No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence is that of Incyte clone 3340296 encoding new human procein regulating gene expression PRGB-23 (see AAY58630). The CDNA was initially isolated from spleen tissue cONA library SPLNNOTIO, and the full-length sequence assembled from overlapping clones from a number of libraries. PRGB-23 is expressed in reproductive, developmental and usrologic tissues associated with cancer, inflammation and foctal diseases, disorders or conditions. It is characterised as an Myc-type Hipprocleotides (see AAX57819-69), expression vectors, host cells, polymucleotides (see AAX57839-69), expression vectors, host cells, antibodies, agonists and antagonists. It also provides methods for diagnosing, treating or preventing disorders associated with expression of PRGB. Polymucleotides are also used as sources of probes and primers for diagnosis and monitoring of disease, also for detecting related sequences and in gene mapping

treating, prognosing or preventing and purpoprises.

treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertinity, disorders of pregnancy, ancoulation, polycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine disorders, infertinons (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome). Inflammatory conditions (e.g., mastitis, opphoritis and vaginitis), immune disorders (e.g., congenital and acquired yrthematosus), blood-related disorders (e.g., congenital and acquired yrthematosus), commondeficiencies, autoimmune oophoritis, systemic lupus erythematosus), clond-related disorders. Gend uninary system disorders. Ovarian antigen polypeptides and collumication antigen expression or activity. The polynucleotides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynucleotides may be used a food additives or to prepare antibodies clonding to dispage a food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP41228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polynuclectides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polynuclectides, antibodies against human ovarian antigen of ovarian antigen polynuclectides and polypeptides in diagnosing,
                                                                                                                                                                                                                                                                                                                                                           syndrome;

The invention relates to a combination comprising several polymucleotides having any one of 127 sequences (S1) such as the sequence of human call and the control of the sequence of human call and the control of the sequence of human call control of the sequences and extended or full length gene from a library of mucleic acid sequences, an expression vector containing the nucleic acids, a host cell containing the vector, a purified polypeptide appearing as ADE25750 and ADE25751, producing a profit of polypeptide appearing as ADE25750 and composition comprising a purified antibody that specifically binds to the proteins. The foam cell-expressed nucleic acids are useful for a high throughput detection of differential expression of one or more polymucleotides in a sample. The sample is from a subject with a throughput screening of a library of molecules or compounds to identify a ligand which binds a polymucleotide. The library is chosen from DNA molecules, peptides, proteins and RNA molecules. The protein is compounds to identify at least one ligand which specifically binds a protein, for purifying a ligand from a sample for making a antibody. The compounds to identify at least one ligand which specifically binds a protein, for purifying a ligand from a sample for making a antibody. The compounds to identify at least one ligand which specifically binds a protein cardiovascular disorder. The foam cell-expressed nucleic acids are useful for a macroarray which can be used for detecting related cardiovascular disorder. The foam cell-expressed nucleic acids are useful search or a microarray which can be used for detecting related the proper of the process 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          atherosclerosis. The present sequence_represents a cDNA whose expression is upregulated in LPS treated foam cells.
                                                                                                                                                                                                                                                       Combination containing several polynucleotide that are differentially expressed in foam cells and complements of the polynucleotides, useful for diagnosing cardiovascular disease or atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 2177 BP; 423 A; 691 C; 650 G; 413 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   2177

Sequences AAA72382-A72436 represent cDNAs encoding novel human nucleic acid-binding proteins (NAABPs, AAB20997-B21051). These cDNAs were produced by extension from an appropriate EST (expressed sequence tag) using primers designed using the EST. The invention also relates to expression constructs, host cells and transgenic organisms comprising a

the human NuABP nucleic acid, recombinant production of the human NuABPS, and also to methods of screening antibodies against the human NuABPS, and also to methods of screening condulators of human NuABPs, and their agonists and antagonists are used to treat diseases associated with coverexpression or underexpression of functional NuABPs. Human NuABP coverexpression or underexpression of functional NuABPs. Human NuABP coverexpression or underexpression of functional NuABPs. Human NuABP coverence and prevent reproductive, immunological, neurological and cell proliferative disorders. Reproductive disorders that may be treated using compositions of the invention include infertility, condematriosis, disruptions of the menstrual cycle and disruptions of disease and systemic luupus erythematosus.

Neurological disorders that may be treated include epilepsy, neurodegenerative conditions such as Alzheimer's disease and Parkinson's disease, prion diseases such as Cheutzfeldt-Jakob disease, and mental cycle atherosclerosis, cirrhosis and psociasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     146

New genes regulated by MYCN activation, useful in gene therapy, particularly for treating a subject with e.g. neuroblastoma or other cancers, or for diagnosing, staging or monitoring the treatment of the

Claim 1; SEQ ID NO 120; 27pp; English

cancer

This invention relates to novel isolated cDNAs that are differentially expressed in MYCN activated cells. Specifically, it refers to polymocleotide sequences that exhibit differential expression patterns in cells activated by the transactivator MYCN, where MYCN is a protononcogene that is amplified in neuroblastoma cells and is common in small cells and to common in small cells ung cancers. The present invention describes these cDNA molecules or useful for in hybridisation assays to detect expression of nucleic acids (or complementary nucleic acids) in a present in a given sample, as useful for in hybridisation assays to detect expression of nucleic specifically bind the cDNA as a ligand and modulate function or activity. Accordingly, these compositions exhibit cytostatic activity and can also be used for gene therapy purposes. This polymucleotide sequence is a cDNA that is differentially expressed in MYCN activated cells, given in an exemplification of the invention. NOTE: This sequence does not appear in the printed specification but has been obtained in electronic format from the United Speciment Office. ftp.seqdata.uspto.gov/sequence.html?DocID=20030119009

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      82
        Composition useful for diagnosis of conditions, disorders or diseases associated with atherosclerosis, comprises several polynucleotides that are differentially expressed in foam cell development.
                                                                                                 The present invention relates to the isolation of human polynucleotide sequences that are differentially expressed during feam cell differentiation. The polynucleotide sequences of the invention or a composition comprising these polynucleotides are useful as a high throughput method for detecting altered expression of one or more polynucleotides in a sample. The polynucleotides can be used in the diagnosis of disorders associated with foam cell development such as atherosclerosis, cerebral stroke, and cardiovascular disorders such as coronary artery disease. The polynucleotide sequences can also be used PCR primers and probes. The polynucleotide sequences can also be used useful in gene therapy. AAS$4746-AAS$5021 represent the human polynucleotide sequences of the invention are also polynucleotide sequences of the invention which are differentially expressed during foam cell differentiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 MetSerThrGlySerLeuSerAspValGluAspLeuGlnGluValGluMetLeuGluCys

The present cDNA sequence encodes murine musculin bHLH (basic helix-loophelix) protein, which is a transcription factor associated with genes from the lused in myogenesis. Musculin gene can be used in genetic screening for myogenic disease conditions, for detecting abberations in muscle development and in gene therapy. Anti-musculin antibodies can be used as therapeutic or dispostic agents. Musculin has cytostatic activity and can be used to treat myogenic disease conditions like myopathies, muscular dystrophies, neuromuscular and skeletomuscular disorders and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        93
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    73
                                                                                                                         The present cDNA sequence encodes human musculin bHLH (basic helix-loop helix) protein, which is a transcription factor associated with genes involved in myogenesis. Musculin gene can be used in genetic screening for myogenic disease conditions, for detecting abberations in muscle development and in gene therapy. Anti-musculin antibodies can be used a therapeutic or diagnostic agente. Musculin has expostatic activity and can be used to treat myogenic disease conditions like myopathies, muscular dystrophies, neuromuscular and skeletomuscular disorders and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  LysLeuSerLysLeuAspThrLeuArgLeuAlaSerSerTyrIleAlaHisLeuArgGln

The invention relates to an isolated polymucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH5081, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polympetide comprising a sequence corresponding to a reading frame of the novel polymucleotide. The nucleic acid sequences care useful in diagnostics as expressed sequence tags (BST) for identifying expressed gene or for physical mapping of the human genome, in fernatics, in assessing bloidiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, for formomesm and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antisense DNA or RNA. The purified polypeptide is useful for generating antisense specific for it. The present sequence is one of the 38043 isolated CDNA/BST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from userio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating
                                                                                                                                                                              SBH; expressed sequence tag; EST;

The invention relates to a combination which, comprises a number of polymucleotide probes comprising a sequence selected from one of the 1490 sequences mentioned in the specification. The combination is useful as an seray element in a microarray for monitoring the expression of a number of target polymucleotides. The microarray is particularly useful in the diagnostic and immunopathology and neuropathology. The microarray is useful in diagnostics and treatment regimens, drug discovery and development, toxicological and carcinogenicity studies, of oremsics and pharmacogenomics. The microarray is also useful for monitoring progression of diseases and for developing sophisticated profiles for the effects of currently available therapeutic drugs. The combination is also useful for purifying a subpopulation of mRNAs, cDNAs array can detect changes in expression in a large number of genes coding for different signaling pathway populations which can be used to diagnose or and penomic fragments and in research and diagnostic applications. The array can detect changes in expression in a large number of genes coding for different signaling pathway populations which can be used to diagnose or and parkinson's disease and penalties e.g. AIDS and aathma, neuropathies e.g. Alzhainer's disease and Parkinson's disease. The present sequence represents a polynucleotide form part of the printed Segmence and a to this patent did not form part of the printed sequence data for this patent did not form at directly from USPTO at

comprising at least a portion of a gene encoding a transducing comprising at least a portion of a gene encoding a transducing polypeptide and third polymucleotide probes comprising at least a portion of a gene encoding an effector-like polypeptide. The probes of the composition are useful as array elements in a microarray for monitoring the expression of target polymucleotides. The microarray for monitoring classical and cardent, an immunopathology or a neuropathology. It can also be used for drug discovery and development, contrological and carcinogenicity studies, forensics or pharmacogenomics. Microarrays can also be used for monitoring the progression of diseases that may be associated with the anitoring the progression of diseases that may be associated with the altered expression of signalling pathway polypeptides. The composition can also be used to purify a subpopulation of manns, constitution of a sample. The expression profile is also useful for the diagnosis and treatment of cancer, e.g. cancers of the adrenal gland, bladder, bone, bone marrow, brain, breast or cervix, an immunopathology, e.g. dementia, amnesta, epilepsy, Alzheimer's disease or depression. This sequence represents a chiman polymucleotide probe of the invention. Note: The sequence data for this patent did not form part of the printed specification but was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           erArgLeuLysThrThrLeuProTrpValProProAspThrLysLeuSerLysLeuAspT 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CCAGACTCAAGACCACCTGCCTGGGTGCCCCCGGACACCAAGCTCTCCAAGCTGGACA 180

The present invention describes a method (M1) for screening for an antinoplastic agent. The method involves exposing cells to a chemical agent to to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancinoma, neuronedocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Carter KC, Ebner R, Endress G, Horrigan S;

                                                                                                                                        8
                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method (MI) for screening for an antinoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in comprises a sequence (S) selected from 844° sequences (St. where (I) comprises a sequence (S) selected from 844° sequences (given in ABL61664 to ABL70110), or is at least 954 identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data oblected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adminesting ductal cancer, infiltrating ductal cancer, infiltrating ductal cancer, infiltrating ductal cancer, infiltrating cancer, infiltrating ductal cancer, infiltrating ductal cancer, infiltrating ductal cancer, infiltrating ductal cancer, infiltrating and Wilm's call.
                                                                                                                                                                                                                                                                                                                                                                              Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                    Horrigan S;

The invention relates to a method of diagnosing (1) the onset or progression of benign prostatic hyperplasia (BPH), or screening (II) for or indentifying an agent that modulates the onset or progression of BPH.

The method is based on changes in gene expression in BPH tissue isolated from patients exhibiting different clinical states of prostate class or progression for the screening of its comparises of prostate cells from the subject that are differentially regulated compared to normal prostate cells from the subject that are differentially regulated compared to normal prostate cells from the subject that are differentially regulated compared to normal prostate cells from the subject that are differentially regulated compared to normal prostate cells or BPH-like cell population, exposing the calls to the agent, preparing a second gene expression profile of the agent exposed cells, and comparing the first and second gene expression of BPH. (II) is useful confident or progression of BPH. (II) is useful for diagnosing the first or progression of BPH. (II) is useful cor in a tissue or cells, by comparing the expression level of expression in the database, and displaying the expression levels given in the generic and displaying the expression levels or expression level or expression level in the database, and displaying the expression levels or expression level in the database or cells to the leading BPH or progression the level in a tissue or expression for the restrict or expression level in the database, and displaying the expression levels or expression levels are useful for treating BPH or progression the level in a tissue or expression levels are useful for treating BPH or progression the level of the lead of the 
Identifying drugs for and diagnosing benign prostatic hyperplasia, by detecting expression levels of one or more genes in prostate cells fropatient that are differentially regulated compared to normal prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         human benign prostatic

Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide

sequences are also useful as hybridisation probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antibodies specific for it. The present sequence is useful for generating antibodies specific for it. The present sequence is one of the 38043 isolated cONA/EST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 175

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                     9053458

requests: clonerequest@sanger.ac.uk  On Oct 1, 2000 this sequence version replaced gi:10186519.  During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.  The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:  EMBL, Sw., SWISSPROT, Tr., TREMBL, Wp., WORMPEP, Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping Group. Further information can be found at http://www.sanger.ac.uk/REPP/Chr6  IMDORTANT: This sequence is not the entire insert of clone RPI-373A10 It may be shorter because we sequence overlapping sections only once, except for a 100 base overlap. The true right end of clone RPI-73H22 is at 25087 in this sequence. The true right end of clone RPI-662A9 is at 100 in this sequence. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequence is annotated repeats but not necessarily within known annotated repeats but not necessarily within known amounted before the library RPI-112 constructed by the group	RP11-373A10 is from the library RPCI-11.2 constructed by the group of Fieter de Jong. This Clone is available from RZPD;
content RZPD (customer.service@rzpd.de) for further information.
This CDS clone is a part of a collection of human full length
expression clones generated by RZPD.
This CDS has been cloned without stopcodon.
The CDS has been inserted into pDONR201 via a BP Clonase(TM)
Faction. Additional sequence has been added in front of the start
codon (ATG): att. ADADAA GCT GGC ACC CCT GGT CAC GCT
After the last codon additional sequence has been added: CCA
GCC GCA GCG Gin front of the 3' att site (AC CCA GCT TTC TT).
Compared to the reference sequence NM_003206 we did not find any
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CR450293 S37 bp mRNA linear PRI 18-MAY-2004 Homo sapiens full open reading frame cDNA clone RZPD0834B11D for gene TCF21, transcription factor 21; complete cds; without
